

DDS Pro Update Features for ver. 8.23

Real Time Filtering - Better images - faster! Real time filtering is one of the most significant additions to CADI v8. Manipulating your images for better quality has become a very easy process with the **New Filtering Window**. **New Integrated Filters**, you will get a better result much faster.

Advanced Filtering – gives you live previews of multiple different filters applied to the image, in acquisition or back on the main CADI screen. Select the filter you want for the image and apply that filter to the device that acquired the image. All filters are customizable so you can create your own.

Better protection against network failure - The new version is also **network sensitive** and will warn you when your network is no longer available or if another program prevents CADI v8 from saving images.

Enhanced salvage module - images will be saved to patient that they were acquired.

Integration with Dentrax Smart Image – Integration with Dentrax “Smart Image”, 2-way communication of images between DDS Pro Imaging and Dentrax practice management **ver.G7**, with the Smart Image function activated.

More User-Friendly Annotations Toolbox - Improved annotation measurement text movement behavior.

New Hardware Integrations:

- Air Techniques – Vistascan 2.0 devices
- Acteon Pan / Ceph / CT
- CADI Optimum-Air sensor
- ErgoRay Intraoral X-Ray Sensors
- Chinese iRay / Woodpecker / & Dentron Sensors
- Owandy I-MAX Pro Pan/Ceph/CT
- QuickVision 3D viewer
